The global Restructured Collagen for Skin Care market size is predicted to grow from US\$ 262 million in 2025 to US\$ 2300 million in 2032; it is expected to grow at a CAGR of 35.0% from 2026 to 2032.

Recombinant collagen for skin care refers to collagen functional raw materials or terminal product ingredients prepared by genetic engineering, microbial fermentation, plant expression or cell culture and used for skin care, repair, medical art post care, effective skin management and skin barrier improvement. Common types include recombinant type I collagen, recombinant type III collagen, recombinant type XVII collagen, etc., which are mainly used in essence solution, facial mask, gel, cream, freeze-dried powder, dressing and medical beauty repair products.

Recombinant collagen refers to a type of collagen produced through the use of genetic engineering, synthetic biology, and other technologies to design specific sequences of collagen related genes, perform enzyme digestion and splicing, connect vectors, and transfer them into different hosts (which can be microorganisms, animals, or plants, but the difficulty and cost of animal and plant systems make microbial systems dominant in commercial production). This type of collagen is then fermented and expressed.

The production of recombinant collagen protein uses genetic engineering technology, which involves enzymatic cleavage, splicing, and expression of the target gene. The production of recombinant collagen involves four steps: gene recombination, cell factory construction, fermentation, and separation and purification. The key to production lies in: 1) how to use gene recombination to select suitable gene fragments and express sequences with biological activity. At present, recombinant collagen produced by microbial fermentation cannot form a stable triple helix, and its biological activity is

questionable. 2) How to reduce separation and purification costs and improve the purity of recombinant collagen. The separation and purification step is a limiting step for the mass production of recombinant collagen. The cost of supernatant recovery, collagen purification, and detection accounts for about 40% of the production cost. If the purity is too low, it will affect the product quality and raw material utilization rate. In 2025, global Restructured Collagen for Skin Care production reached approximately 184 Tons, with an average global market price of around US\$ 1,456 per kg.

Recombinant collagen for skin care is currently in a high growth stage, with demand coming from the upgrading of efficacy skincare, increased medical art post repair, expansion of sensitive skin care, increased consumer awareness of bioactive ingredients, and an increasing trend of replacing animal derived collagen. Compared with traditional animal derived collagen, recombinant collagen has advantages in controllable sources, batch consistency, low immune risk, designability, and ingredient storytelling, making it suitable for high-end repair, anti-aging, barrier care, and medical beauty scenarios. The future growth focus will be on recombinant type III collagen, full chain collagen, high-purity medical grade raw materials, freeze-dried powder, repair dressings, medical beauty combined care, and sensitive skin care. The industry will still face pressure such as inconsistent ingredient standards, differences in efficacy evaluation, price decline, and homogeneous promotion. Enterprises with stable expression systems, large-scale purification capabilities, efficacy verification capabilities, terminal brand channels, and compliance registration capabilities are more likely to gain sustained competitive advantages.
