Retort packaging for ready-to-eat products refers to high-barrier packaging materials capable of withstanding high-temperature heat sterilization. It is typically made of multi-layered composite structures, such as combinations of polyester, aluminum foil, nylon, and polypropylene. This type of packaging offers excellent high-temperature resistance, oxygen barrier properties, moisture protection, and light-blocking capabilities, ensuring long-term storage of food at room temperature. Retort packaging is widely used for ready-to-eat meals, soups, sauces, seafood, pet food, and other foods stored at room temperature. After sealing, the packaging undergoes high-temperature retort sterilization, effectively eliminating microorganisms while preserving the food's flavor and nutritional value. The retort packaging industry chain includes upstream polymer resins, aluminum foil, adhesives, inks, and high-barrier film materials. Midstream processes include film extrusion, lamination, printing, bag or container forming, and quality testing. Downstream applications primarily include ready-to-eat food manufacturers, food processing companies, seafood processing companies, pet food manufacturers, and branded food companies. Supporting industries include packaging equipment, sterilization equipment, logistics and distribution, and food safety testing services to ensure product quality and food safety standards. In 2025, global production of retort packaging for ready-to-eat products is estimated at 89.7 billion units, with an average global market price of approximately US\$70 per thousand units. The gross profit margin of major companies in the industry ranges from 20% to 35%. In 2025, global production capacity for retort packaging for ready-to-eat products is estimated at 119.6 billion units.

The Retort Packaging for Ready-to-eat Products market is experiencing strong growth driven by increasing consumer demand for convenient and shelf-stable food products. Urbanization, busy lifestyles, and the rapid expansion of the ready-to-eat meal market are major factors supporting demand. Retort packaging provides excellent food safety and extended shelf life without the need for refrigeration, making it highly suitable for modern food distribution systems. Technological advancements in multilayer film structures, barrier coatings, and printing technologies are improving packaging durability and visual appeal. Additionally, manufacturers are developing thinner and more sustainable materials to reduce environmental impact while maintaining performance. The expansion of e-commerce food delivery and international food trade is also boosting demand for reliable long-shelf-life packaging solutions. As consumer preferences shift toward convenience foods, the global market for retort packaging is expected to maintain steady growth in the coming years.
