A reverberatory melting furnace is a specialized piece of equipment used in metals processing, particularly in the smelting of lead and other heavy metals. It operates by using a burner outside of the furnace to heat up the inside of the unit, causing indirect radiation heating throughout the interior space. This method provides even heating and better control over temperatures compared to direct fired units. They differ from conventional furnaces in their ability to remove impurities through the natural flow of gases, thus producing purified finished products. Compared to other furnace types they tend to consume less fuel per ton of metal produced due to greater efficiency.
