A reverse air baghouse dust collector is a type of industrial air pollution control equipment used to remove particulate matter from exhaust gases generated by various manufacturing processes. It consists of a series of fabric filter bags arranged in a cylindrical housing. The contaminated air enters the collector and passes through the fabric bags, while the particulate matter is captured on the exterior surface of the bags. Unlike a pulse jet baghouse, which uses short pulses of compressed air to dislodge the dust cake from the bags, a reverse air baghouse employs a reverse airflow mechanism to clean the bags. During the cleaning cycle, the airflow is temporarily reversed, causing the bags to expand and dislodge the accumulated dust, which then falls into a hopper for disposal. Reverse air baghouse dust collectors are commonly used in applications where high air-to-cloth ratios are required, or where the dust particles are sticky or difficult to remove. They are often utilized in industries such as cement, steel, power generation, and minerals processing to maintain clean air quality and comply with environmental regulations.

The global Reverse Air Bag House Dust Collector market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
