Reverse transcription polymerase chain reaction (RT-PCR) is a popular in vitro method and has an important application in the medical science and biomaterial industry. DNA: RNA is utilized as a template for reverse transcription. Reverse transcriptase enzyme uses mRNA to produce cDNA, a single stranded DNA. This process is known as reverse transcription. In a further process, the DNA polymerase converts single stranded cDNA into double stranded DNA, which could be used as a template for PCR reaction. Reverse transcription polymerase chain reaction is utilized in a laboratory to study gene expression, in the diagnosis of genetic diseases, and in pharmacotherapy. RT-PCR is primarily used to measure mRNA level and the surface proteins and is feasible in the clinical laboratories. RT-PCR is used in detecting the mRNAs, pre-mRNAs, non-coding RNA, and other types of RNA. RT-PCR requires buffer, thermocyclers, nucleotides, template, and enzyme for constructing RT-PCR products. RT-PCR is used as a diagnostic tool for severe acute respiratory syndrome, including Coronavirus indication. RT-PCR test is a rapid and reliable diagnostic assay for detecting coronavirus disease.
