Reversed Phase HPLC Columns are the most commonly used separation media in liquid chromatography (HPLC). The stationary phase is usually a hydrophobic material (such as C18, C8 bonded silica gel), and the mobile phase is a polar solvent (such as water/methanol/acetonitrile). The separation principle is based on the hydrophobic interaction between the stationary phase and the mobile phase of the analyte. It is suitable for the separation and analysis of non-polar or weakly polar compounds and is widely used in pharmaceutical, environmental testing, food analysis, biomedicine and other fields.

United States market for Reversed Phase HPLC Columns is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
