Reversed-phase silica packing is a chromatographic separation material based on high-purity porous silica, with its surface chemically modified with non-polar functional groups. The most common bonded phases are C18 (octadecyl), C8, C4, or phenyl. In reversed-phase HPLC (RP-HPLC), it utilizes hydrophobic interactions to achieve efficient separation of moderately polar to non-polar compounds. It is widely used in the analysis and purification of small molecule drugs, peptides, proteins, and natural products. This packing possesses a high specific surface area, excellent mechanical strength, and chemical stability, making it one of the most commonly used stationary phases in high-performance liquid chromatography (HPLC) and preparative chromatography.In 2024, the global production of reverse phase silica gel filler will reach 3,192 kg, with an average selling price of US$27,778 per kg.

United States market for Reversed Phase Silica Packing is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
