The global RF Frequency Multiplier market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

RF frequency multipliers are nonlinear devices that produce an output signal with a frequency that is larger than the frequency of a corresponding input signal by a predetermined factor. RF frequency multipliers operate over a specific input frequency range and are able to suppress or reduce unwanted harmonics from the output signal. There are two basic types of devices: active and passive. Active RF multipliers produce an output signal with a power level that is larger than that of the input signal. The power level difference between the output signal and the input signal is called conversion gain, an amount that is measured in decibels (dB) and expressed as a positive number. Passive RF multipliers produce an output signal with a power level that is smaller than that of the input signal. The difference in power levels between the output signal and the input signal is called conversion loss, an amount that is expressed in decibels. Conversion loss is a negative number, but usually specified as an absolute value.

United States market for RF Frequency Multiplier is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
