The global RF Integrated Passive Device market size is predicted to grow from US\$ 727 million in 2025 to US\$ 1413 million in 2032; it is expected to grow at a CAGR of 10.0% from 2026 to 2032.

RF Integrated Passive Device refers to a type of electronic component that monolithically or hybrid integrates passive elements such as resistors, capacitors, inductors, filters, couplers and baluns into a single package or substrate. It adopts technologies like thin film and low-temperature co-fired ceramic (LTCC) to realize integration, with optional substrates silicon, glass, gallium arsenide (GaAs) and other materials, featuring small size, high integration, stable signal integrity and low power consumption, which is essential for optimizing performance of high-frequency communication systems while reducing overall device volume and cost.

Driven by the deepening deployment of 5G networks, the rise of IoT and the rapid development of automotive electronics, the market demand for RF IPDs maintains steady growth, with rigid demand from consumer electronics such as smartphones and wearable devices, and incremental demand from automotive ADAS, V2X, aerospace and defense fields. The trend of device miniaturization and high-frequency communication further boosts the replacement demand for RF IPDs to replace discrete passive components. Business opportunities lie in the R&D of high-performance products adapted to 5G-A and 6G pre-research, the development of non-silicon substrate-based RF IPDs to break technical bottlenecks, the expansion of automotive-grade products meeting high reliability requirements, and the layout of domestic substitution to seize the market dividend brought by supply chain autonomy, as well as the integration with advanced packaging technologies like SiP to provide integrated solutions.
