RFID, or Radio-Frequency Identification, is a technology that uses radio waves to communicate between a reader and a passive RFID tag or card. The RFID card, also known as a transponder, contains a microchip that stores and processes information, as well as an antenna that transmits and receives the radio signals. There are several types of RFID chips available, each with different capabilities and characteristics.

Ultra-High-Frequency (UHF) RFID chips, which operate at frequencies between 300 MHz and 3 GHz. They have a read range of up to 10 meters and are often used for inventory tracking and supply chain management. Active RFID tags have own power

source and can have much larger range and transmit much more data.

Low-Frequency (LF) RFID chips, which operate at frequencies between 30 kHz and 300 kHz. They have a short read range of a few centimeters and are typically used for applications such as access control and animal identification. Low frequency RFID Cards mostly called “Proximity Cards” are usually used in identification and access control applications. LF cards have lower read range and communication speeds than other RFID Card types and the most common chips offer low-cost and low-security solutions where a simple UID or identification key is required. High Frequency RFID Cards (HF)

High frequency is the most diverse category of contactless and RFID smart card and is used as ID cards, access control, payments and loyalty cards, transport and ticketing. 13.56Mhz HF cards are complied by ISO/IEC 14443A/B or ISO/IEC 15693 standards and range from simple fixed memory to high security Java and PKI processor cards. Ultra High Frequency RFID Cards (UHF) follows the EPCglobal Gen2 standard and uses the 850—960Mhz frequency band to provide long-range data transfer (up to 10m) compared to LF or HF cards. UHF labels and tags are used extensively in warehousing and product tracking while UHF cards are popular choice for location and attendance tracking applications.
