The global Rhenium powders market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Rhenium is a chemical element; it has symbol Re and atomic number 75. It is a silvery-gray, heavy, third-row transition metal in group 7 of the periodic table. With an estimated average concentration of 1 part per billion (ppb), rhenium is one of the rarest elements in the Earth's crust. It resembles manganese and technetium chemically and is mainly obtained as a by-product of the extraction and refinement of molybdenum and copper ores. Rhenium has the highest density, second only to platinum, iridium and osmium. It has the highest purity and consistent certified product quality, and only tungsten and carbon have higher melting points than rhenium. Rhenium has good wear resistance and is able to resist arc corrosion. It is soluble in nitric acid and sulfuric acid. This report focuses on rhenium powder. Rhenium powder is a light gray metal powder made of aggregated single crystals.

United States market for Rhenium powders is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
