Nephroscope is a fiber optic instrument used in examination and visualization of the kidney through an inserted tube. Nephroscope contains three channels mainly for fiber optic light, telescope and irrigation. Nephroscopy is a non-surgical way of examining the inside of the kidneys and treating certain conditions in the upper urinary tract. Nephroscopy is a non-invasive and safe procedure that reduces the need for traditional surgery.

In addition, it can also prevent the need for future surgeries for kidney stones and other problems. Nephroscope instruments has a narrow width which ensures comfort and provides superior image quality with optimized working condition. A nephroscope basically uses an ultrasound or a laser probe to break the large kidney stones. These pieces of stones are suctioned out with the scope. Nephroscope is used for laparoscopic bile duct examination, mainly for large impacted stones.
