The global Ring-Tube Axial Flow Pump market size is predicted to grow from US$ 1320 million in 2025 to US$ 1722 million in 2032; it is expected to grow at a CAGR of 3.9% from 2026 to 2032.

In 2024, global Ring-Tube Axial Flow Pump production reached approximately 25k units, with an average global market price of around US$ 53k per unit.

A ring-tube axial flow pump (often referred to as a tubular axial flow pump or casing-pipe axial flow pump) is a type of axial-flow pump in which the hydraulic components are arranged inside a closed tubular or ring-shaped casing that can be directly integrated into pipelines or pump-station structures. Designed primarily for large-flow, low-head applications, it uses an axial-flow impeller mounted on a pump shaft driven by an electric motor (directly or via gear/belt transmission) and converts energy within a tubular or annular flow passage, together with inlet and outlet cones, guide vanes, and bearing supports to form a complete pumping unit. Ring-tube axial flow pumps are widely used in large drainage and irrigation stations, urban flood-control systems, circulating cooling-water systems of thermal and nuclear power plants, seawater intake for coastal and reclamation projects, etc. Compared with conventional vertical well-type axial-flow pumps, they offer a compact structure, lower hydraulic losses, flexible installation (horizontal, inclined, or vertical layouts), and ease of modular integration into pump stations under varying water levels and layout constraints.
