Abstracts

The global RIPA Cell Lysis Buffer market size is predicted to grow from US$ 259 million in 2025 to US$ 406 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

RIPA cell lysis buffer (Radio-Immunoprecipitation Assay Lysis Buffer) is a commonly used cell lysis reagent, which is widely used to extract total protein from mammalian cells, especially for obtaining intact cytoplasmic, nuclear, membrane proteins and phosphorylated proteins. Its components usually include detergents such as Triton X-100, SDS, sodium deoxycholate, etc., combined with protease and phosphatase inhibitors, which can effectively lyse cells and stabilize protein structure, maintain protein activity, and facilitate subsequent experiments such as Western blot, co-immunoprecipitation (Co-IP), and ELISA. RIPA lysis buffer has become a standard reagent for routine experiments in life science research due to its efficient lysis ability and wide applicability to a variety of cell types.

With the in-depth development of research fields such as proteomics, cell signaling pathways, and tumor mechanisms, the market demand for RIPA lysis buffer continues to grow, especially in biomedical research and development, university scientific research, and preclinical trials. According to market research reports, the global cell lysis reagent market is valued at approximately US$250 million in 2024, of which RIPA lysis buffer accounts for a large share. With an annual compound growth rate of more than 6%. In the future, with the rapid development of high-throughput screening, automated protein detection platforms and personalized medicine, the demand for high-performance, high-purity lysis solutions will also increase simultaneously, driving the iterative upgrading of related reagent products towards higher stability, stronger compatibility and greater refinement.
