The global RIPA Extraction Buffer market size is predicted to grow from US\$ 259 million in 2025 to US\$ 383 million in 2031; it is expected to grow at a CAGR of 6.7% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

RIPA cell extraction buffer is a commonly used protein lysis buffer, which is widely used for cell lysis to extract total protein. It is particularly suitable for extracting cytoplasmic, nuclear and membrane proteins from mammalian cells or tissues. Its main components include Tris-HCl, NaCl, NP-40 or Triton X-100, SDS (sodium dodecyl sulfate) and sodium deoxycholate, which can effectively destroy cell membranes and release various cell components. Due to its strong lysis ability, RIPA buffer is often used in protein detection experiments such as Western blot, immunoprecipitation (IP) and ELISA.

The development trend is mainly reflected in several aspects: first, the formula is optimized, and modified RIPA buffers for specific cell types or subcellular structures gradually appear, making protein extraction more selective and compatible; second, commercial pre-formulated products are constantly enriched, which improves the repeatability and convenience of experiments; third, green development, focusing on removing highly toxic ingredients (such as alternatives to SDS or Triton X-100) to reduce the exposure risk of laboratory personnel and the environmental burden; in addition, ready-to-use RIPA buffers combined with protease and phosphatase inhibitors are also becoming increasingly popular, and are more suitable for applications such as

signal pathway research that require protection of protein modification status.

United States market for RIPA Extraction Buffer is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
