Abstracts

The global RIPA Lysis and Extraction Buffer market size is predicted to grow from US$ 37.17 million in 2025 to US$ 78.13 million in 2032; it is expected to grow at a CAGR of 11.4% from 2026 to 2032.

RIPA lysis and extraction buffer is a lysis buffer commonly used for total protein extraction from mammalian cells and tissues, particularly for extracting proteins from cell membranes, cytoplasm, and nuclei. It contains potent ionic and non-ionic detergents (such as SDS, NP-40, or Triton X-100), which effectively lyse cell membranes and disrupt protein complexes while preserving protein activity. It is commonly used in downstream experiments such as Western blot, immunoprecipitation (IP), and enzyme activity assays. Protease and phosphatase inhibitors are often added to prevent protein degradation or dephosphorylation.Sales volume in 2024 will be 324,000 units, with an average price of US$105 per unit.

As a fundamental experimental reagent, RIPA lysis and extraction buffers have a market demand that is highly relevant to industries such as life sciences, medical research, biopharmaceuticals, and molecular diagnostics. With the continued increase in global research investment in cutting-edge fields such as oncology, neuroscience, and immunology, particularly in proteomics and signaling pathway research, the demand for efficient, stable, and customizable lysis buffers is steadily growing.

Furthermore, the bioreagent industry is trending from traditional scientific research applications to industrial-grade applications and adaptation to automated experimental platforms. The increasing demands for high-throughput protein extraction, standardized sample processing, and the preservation of protein activity are driving manufacturers to develop new RIPA buffers with more precise functionality and a more comprehensive

set of inhibitors. In the future, lysis buffers that demonstrate high stability, lack of residual toxicity, and are compatible with automated systems will be more competitive in the market.
