The global RMS Detectors market size is predicted to grow from US\$ 40.88 million in 2025 to US\$ 59.05 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

An RMS detector is a device used to measure the power of radio frequency (RF) signals, especially suitable for high dynamic range signal measurements. The RMS detector converts the RF signal into a DC voltage through a square-law detection circuit, then removes the high-frequency component through a low-pass filter, and finally obtains the root mean square value through a square root operation, thereby achieving accurate measurement of signal power.

Global sales exceeded one million units in 2024, with an average market price of approximately \$5 per unit. The industry's gross profit margin ranged from 25% to 40%.

The RMS detector converts the radio frequency signal into a DC voltage using a square-law detection circuit, then removes high-frequency components using a low-pass filter, and finally calculates the root mean square (RMS) value of the signal through square root operation, thus achieving accurate measurement of signal power. This method is particularly suitable for measuring signals with high dynamic range. The industry is highly concentrated among a few international manufacturers, primarily led by Analog Devices (ADI) and Texas Instruments (TI). Driven by the testing demands of satellite communications, the Internet of Things (IoT), and millimeter-wave radar, the technological barriers will further increase, and international leaders will continue to hold the reins.
