## Abstracts

The global RO Booster Pump market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An RO (Reverse Osmosis) booster pump is a device used to increase water pressure in reverse osmosis filtration systems. RO systems rely on water pressure to push water molecules through a semipermeable membrane, effectively removing contaminants and producing purified water. In cases where water pressure is too low (typically below 50 psi), an RO booster pump helps to increase the pressure, improving the efficiency and performance of the filtration process.
