The global Road Joint Sealant market size is predicted to grow from US\$ 1057 million in 2025 to US\$ 1476 million in 2032; it is expected to grow at a CAGR of 4.9% from 2026 to 2032.

Road joint sealant is an elastic sealing material used for sealing joints, cracks, and construction seams in traffic pavements such as asphalt roads, cement concrete roads, bridge decks, airport pavements, and parking lots. The product's gross margin is approximately 31%.

Demand for road joint sealants mainly comes from preventive maintenance of existing roads, airport pavements, bridge decks, and parking lots. As the stock of highway assets expands, maintenance budgets are shifting from major repairs toward early-stage joint sealing, crack sealing, and joint waterproofing. The value of joint sealants in delaying crack propagation, reducing water damage, and lowering life-cycle maintenance costs is becoming more acceptable to owners.

In terms of product structure, hot-applied rubberized asphalt remains the mainstream material for road maintenance. It is price-sensitive but used in large volumes. Silicone, polyurethane, and polysulfide systems are more often used in cement concrete pavements, bridges, airports, and high-movement joints, with higher unit prices and gross margins. Buyers typically focus on material system, applicable temperature range, movement capability, fuel and salt spray resistance, traffic reopening time, and compliance with ASTM, AASHTO, FAA, or local highway specifications.

Growth is driven by normalized infrastructure maintenance, upgraded airport and bridge joints, replacement with more durable materials in cold regions, and wider adoption of mechanized application. Key constraints include price fluctuations in asphalt, synthetic rubber, and polyurethane/silicone raw materials, as well as competition from low-cost

local products in regional markets.
