Road marking embedded reflective glass beads are specially engineered spherical glass particles that are incorporated into road marking materials—such as thermoplastic, waterborne, or solvent-based paints—to enhance nighttime visibility and driver safety. These beads are either premixed into the marking compound or applied on the surface as drop-on beads, embedding partially into the paint as it cures. When vehicle headlights shine on the road markings, the embedded glass beads retro-reflect the light back toward the driver, making lane lines, pedestrian crossings, and other traffic indicators highly visible in low-light or wet conditions. Their optical clarity, roundness, and refractive index are critical for maximizing reflectivity and durability in diverse roadway environments.
