The robot force control polishing workstation is an automated grinding equipment that combines advanced robotic technology and force control systems. It is designed to meet the growing market demand for grinding products such as round pipes and metal parts. Its design focuses on the grinding, polishing and polishing of die-casting parts. Surface preparation tasks such as deburring. By integrating core components such as robots, force control systems, grinding units, floating spindles, and polishing machines, this workstation has significant advantages of high quality, efficiency, and peace of mind, and achieves high-precision force control within $\pm 1\text{N}$ at the technical level. . The built-in high-precision sensors such as pressure sensor, displacement sensor and attitude inclination sensor enable the workstation to sense the robot's spatial attitude and the contact state between the grinding tool and the workpiece in real time, thereby achieving precise control of the grinding force. In addition, its rapid response capability ensures that the robot can instantly adjust the grinding parameters during the grinding process to adapt to changes in the workpiece surface, thereby improving grinding efficiency and quality. At the same time, with the help of advanced control algorithms, the workstation can process sensor input signals in real time and pass The output control value accurately controls the high-precision electrical proportional valve to achieve fast and precise force control effect.
