The global Robot Frameless Motor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Frameless motor is a new type of torque motor designed specifically for applications with small volume, light weight, low inertia, compact structure, and high power requirements; By adopting electromagnetic design optimization technology, the torque density is increased while reducing the motor tooth slot effect, resulting in smoother operation. The product appearance and lifespan are improved through the use of adhesive packaging technology to cope with different complex working conditions. The frameless motor is considered the core component of robot joints. In addition to its applications in this field, Edess frameless motors are also used in precision instruments with high precision requirements and semiconductor production equipment with high stability requirements. The frameless motor developed by Edes has advantages in lightweight, high power, high precision, high stability, and other aspects.
