The global Robot Joint Harmonic Reducer market size is predicted to grow from US$ 506 million in 2025 to US$ 1331 million in 2031; it is expected to grow at a CAGR of 17.5% from 2025 to 2031.

The harmonic reducer is one of the three core components of industrial robots and is currently one of the key components with the highest technical barriers. Actually, reducers are not unfamiliar to us in the field of mechanical engineering. They are common users in professional courses, and course design and mechanical drawing cannot be separated from their shadows. As shown in Figure 1, precision reducers can be divided into harmonic gear reducers, RV (rotation vector) reducers, cycloidal pinwheel reducers, precision planetary gear reducers, and filter gear reducers according to their structure. Their function is actually to reduce motion speed and increase torque, The purpose is to improve motion accuracy and ensure the stability and reliability of the motion process, but the control speed and accuracy requirements are very high. The principle of this type of reducer is not difficult to understand, but it is difficult to manufacture. On the one hand, there is a lack of relevant industrial motherboards, and on the other hand, there is also a lack of heat treatment process experience, which makes the localization of high-end reducers still a long way to go.

United States market for Robot Joint Harmonic Reducer is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Robot Joint Harmonic Reducer is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
