3D machine vision is a growing trend that delivers accurate, real-time information to improve performance in applications. 3D machine vision detects objects regardless of position. As a result, robots have more flexibility and independence when compared to their 2D only counterparts. Robot vision with 3D lets the machine know if an object is lying down, upright, or hanging.

Robots with 3D machine vision can fulfill various tasks without reprogramming. They can account for unexpected variables in work environments. 3D vision allows robots to know what's in front of them and react properly. 3D imaging is currently being used in metrology, guidance, and defect analysis systems.
