The global Robotic Assisted Percutaneous Coronary Intervention market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Robotic Assisted Percutaneous Coronary Intervention (PCI) refers to a minimally invasive surgical procedure that employs robotic technology to enhance the treatment of coronary artery disease. During this procedure, a catheter is guided through the blood vessels to reach blocked or narrowed coronary arteries, where interventions such as balloon angioplasty or stent placement can be performed. The use of robotic systems allows for greater precision and dexterity, enabling cardiologists to navigate complex anatomies with improved control. This advanced approach reduces the physical strain on surgeons and enhances patient outcomes by minimizing trauma and recovery times.
