The global Robotic Birds market size is predicted to grow from US\$ 235 million in 2025 to US\$ 593 million in 2032; it is expected to grow at a CAGR of 14.2% from 2026 to 2032.

In 2025, global Robotic Bird output reached about 3 million units and global capacity of around 5 million units. The average price is about USD 80 per unit, with gross margins near 36%. Robotic birds are bio-inspired aerial or ground-interacting robots designed to replicate the appearance, movement, and behavior of real birds, often using flapping-wing (ornithopter) mechanisms, lightweight composite structures, embedded sensors (e.g., IMU, cameras), and AI-based control systems for navigation, interaction, or environmental response; they are used in applications such as surveillance, wildlife monitoring, military reconnaissance, research, and entertainment. The supply chain begins upstream with materials and core components including carbon fiber and polymers, micro-motors and actuators, batteries (typically lithium-polymer), MEMS sensors, and semiconductor chips (MCUs, AI processors), supplied by electronics and materials companies; midstream involves system integration by robotics manufacturers and research institutions that design aerodynamics, control algorithms, and embedded software, often incorporating communication modules (RF, GPS, or 5G); downstream consists of distribution to end users such as defense agencies, environmental organizations, research labs, and consumer markets (toys and drones), along with supporting services like software updates, maintenance, and data analytics platforms.

United States market for Robotic Birds is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
