The global Robotic Grippers market size is predicted to grow from US\$ 803 million in 2025 to US\$ 1120 million in 2031; it is expected to grow at a CAGR of 5.7% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

A robot gripper is an end-effector or sometimes called end-of-arm tooling that is used on industrial robots for material handling, e.g., grasping, holding, lifting, moving and controlling materials. Robot grippers are very important tools because without it, industrial robot cannot be used in material handling application. Robot grippers are meant to replace human hands because they are very good for repetitive cycles, handling heavy loads, and operate under extreme temperatures and environments where human hands cannot operate. Since robot grippers are usually custom designed for its particular applications, utmost importance should be given to EOAT while designing.

Market Concentration and Key Players:

Internationally, the market concentration degree of robot gripper is relatively high, mainly concentrated in Europe and America and other developed countries. For example, Robotiq, Destaco and other large manufacturers; from the domestic point of view, Shenzhen Dahuan Robot Technology, Shanghai Flexiverse in the robot gripper occupies the leading position.

Manufacturing Processes and Market Trends:

The manufacturing process of robot gripper is developing in the direction of high precision, intelligence and flexibility. The traditional manufacturing process is mainly based on metal cutting, welding and CNC machine tool processing, and the rigid grasping function is realized through servo motors, sensors and other core components. With the breakthrough of nanoimprint technology, enterprises such as Suzhou New Dimension have realized the manufacturing of sub-micron linewidth structures, and the extinction ratio and transmittance of their metal wire grid polarizers have been significantly improved, providing a new path for the precise control of optical grippers. The manufacture of soft holders relies on 3D printing, silicone molding and other processes.

In terms of market trends, the surge in global demand for industrial robots drives the expansion of the gripper market. China, as the largest consumer market, drives the gripper to upgrade to multi-axis coordination and intelligence. The demand for special scenarios leads to subdivided tracks: semiconductor manufacturing relies on nano-scale positioning grippers to handle wafers; surgical robots in the medical field use force feedback jaws to achieve 0.1N precision operations. Technology fusion has become a key breakthrough point. The combination of AI algorithm and tactile sensor enables the gripper to have dynamic grasp planning capability, while biomimetic materials driven by synthetic biology are improving the corrosion resistance and environmental adaptability of the gripper jaw. In the regional competition pattern, European and American enterprises occupy the high-end market by virtue of precision machining and intelligent control technology, while China manufacturers adopt nano-imprinting and modular design. Innovation catches up quickly. In the future, with the deepening of Industry 4.0 and green manufacturing demand, the gripper with high precision and low energy consumption will become the core component of intelligent factory, and the application potential of flexible clamping technology in agricultural picking, logistics sorting and other scenarios will continue to be released.
