The global Robotic Hull Cleaning Service market size is predicted to grow from US\$ 1237 million in 2025 to US\$ 1691 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

Robotic hull cleaning services refer to marine maintenance services that utilize underwater robots to remove marine biofouling from underwater parts of a ship's hull without requiring it to enter dry dock. Simultaneously, these services include hull surface cleaning, drag optimization, and energy efficiency restoration. This service is typically performed in ports, anchorages, or near-shore environments. Its core objectives are to reduce ship drag, improve fuel efficiency, reduce carbon emissions, and extend the lifespan of antifouling coatings. It is an important underwater maintenance solution in modern green shipping systems.

With increasingly stringent global shipping carbon emission regulations and persistently fluctuating fuel costs, shipowners' demand for energy efficiency optimization continues to rise. Robotic hull cleaning services are rapidly gaining popularity due to their dry-dry-free operation, high efficiency, and significant drag reduction. Furthermore, advancements in underwater robot technology, computer vision-based fouling recognition, and port automation are gradually upgrading this service from manual diving operations to an intelligent, standardized, and remotely controllable industrial service model. In the future, it will continue to penetrate major global shipping routes, offshore platforms, and large merchant fleets, becoming an important component of green shipping and ship lifecycle management.
