Robotic surface treatment is a process that can be widely used in the manufacturing technology industry for a variety of applications ranging from the aerospace industry to the ship industry. This is a need addressed in the industry with robotic automation. Robotic polishing is the process of refining surfaces until they are smooth. This application is repetitive and tedious while requiring extreme consistency. Polishing robots are programmed to apply just the right amount of pressure and move precisely in the right direction, for a consistent, thorough, high-quality product.

A robot for surface treatment is an automated device dedicated to the treatment and finishing of workpiece surfaces. These robots can perform various surface preparation tasks such as grinding, polishing, spraying, cleaning, etching, coating, etc. to improve the quality, appearance and performance of workpieces. Robots for surface preparation are able to automate tasks through pre-programmed paths and procedures, increasing productivity and reducing manual operations. Robots can process workpiece surfaces with a high degree of precision, ensuring that each workpiece is treated consistently and to specification. These robots can perform many different surface preparation tasks and can be adapted to different types of workpieces and processing requirements.
