Robotic strain wave gear reducers are a type of gear system commonly used in robotics and other precision machinery. They consist of three main components: a circular spline, a flex spline, and a wave generator.

The circular spline is a rigid ring with teeth on the inside, while the flex spline is a flexible ring with teeth on the outside. The wave generator is a mechanism that applies a cyclic force to deform the flex spline, causing it to mesh with the teeth of the circular spline. This creates an elliptical motion that drives the output shaft.

These gear reducers are prized for their high precision, compact size, and high gear ratios. They are often used in robotic joints where precise control of position and torque is required. Additionally, they offer zero backlash, meaning there is no play between the input and output shafts, making them ideal for applications where accuracy is paramount.

The global Robotic Strain Wave Gear Reducers market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
