A rocker arm bearing is a critical component in internal combustion engines, specifically within the valvetrain system. Its primary function is to support the rocker arm, which is responsible for transferring the camshaft's rotational motion to the engine's valves. This motion allows the valves to open and close at the correct timing, facilitating the intake of air and fuel and the exhaust of combustion gases. Rocker arm bearings are typically cylindrical in shape and made from materials such as steel or bronze, chosen for their durability and ability to withstand high engine operating temperatures and pressures. These bearings are precision-engineered to provide smooth, low-friction movement of the rocker arm, ensuring efficient engine operation and minimizing wear and tear on both the rocker arm and the camshaft. Rocker arm bearings are found in various types of internal combustion engines, including those used in automobiles, motorcycles, trucks, and agricultural equipment, and are essential for maintaining proper engine performance and longevity.

The global Rocker Arm Bearing market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
