The global Rod Position Detector market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Rod position detector is an equipment used to measure the control rod position in nuclear reactor. Control rods are used in nuclear reactors to control the rate of nuclear reaction and regulate the power generated by the reactor. The rod position detector is an important component of the reactor control system, as it provides real-time feedback on the control rod position. The rod position detector detects the position of the control rod by using a series of sensors. Sensors are typically located at various points along the length of the rod, and they generate electrical signals sent to the control unit. The control unit processes signals and calculates the position of the control rods, which are then displayed on the control panel for operator monitoring. The rod position detector is a key safety component of the nuclear reactor, because it can ensure that the control rod is in the correct position to maintain the safe and stable operation of the reactor. It is designed to operate reliably and accurately under extreme conditions, including high radiation and high temperatures.

United States market for Rod Position Detector is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Rod Position Detector is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
