Capacitors are electronic components that store the corresponding charge. Capacitors play an important role in tuning, bypassing, coupling, filtering and other circuits. Aging test refers to the continuous application of a certain electrical stress to the components under a certain ambient temperature for a long period of time. It is one of the screening methods for capacitors to ensure the reliability level and quality by exposing various potential defects inside the components as soon as possible, so as to achieve the purpose of eliminating early failure products. This article mainly introduces the drum capacitor aging test machine.
