The roller plate blister packaging machine is a device developed on the basis of the roller and flat plate blister packaging machines. It combines the advantages of the drum and flat plate packaging machines and overcomes the shortcomings of the two models. Its main working principle is: blow molding using a flat plate molding device (positive pressure molding) and sealing with a roller sealing device.

After the formed film is heated and softened by the heating device, the blister is sucked out using vacuum negative pressure or positive pressure on the roller-type forming mold roller. The filling device fills the packaged materials into the blister, and then passes through the roller-type heat sealing device. Under appropriate temperature and pressure, the covering film coated with adhesive on one side is sealed on the surface of the blister material, and the packaged items are sealed in the blister.

The roller plate blister packaging machine has the characteristics of high efficiency, saving packaging materials, and good blister quality. At the same time, since roller-type continuous sealing is used, the transmission ratio relationship between the forming mechanism and the punching mechanism can be well coordinated, which can greatly improve packaging efficiency. In addition, this type of machine has a larger filling space, and multiple filling machines can be arranged at the same time, making it easier to package multiple drugs in one section, expanding the packaging range and improving the packaging grade.

The global Roller Plate Blister Packaging Machine market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from

2024 to 2030.
