The Roller Plunger Limit Switch is an electrical switch that controls the opening and closing of a circuit by mechanical means. It consists of a switch head with rollers and a mountable bracket. When the object to be controlled touches the roller on the switch head, the roller will be pushed, so that the circuit inside the switch head is closed or disconnected, so as to play the role of detection or control. Roller limit switches are commonly used where detection of an object's position and range of motion is required.

They can be used in automation equipment, mechanical equipment, industrial control systems, logistics systems, building safety doors and other fields. One advantage of roller limit switches compared to other types of limit switches is that the rollers can better adapt to the surface shape and material of the detected object, thus improving the accuracy and reliability of detection. In addition, the simple structure of the roller limit switch and the convenience of use make it widely used in many industrial and mechanical applications.
