A Rotary Air Preheater is a regenerative high efficiency heat exchanger which utilizes the regenerative element to store the heat of the flue gas and deliver it to air. According to the different parts of its rotating parts, rotating air preheater can be classified as rotor rotation of the drum-type preheater and windshield rotary preheater. The former heat storage element is arranged on the slowly rotating rotor and rotates by the rotor in turn through the flue gas and the air; the latter heat storage element is arranged on the stationary stator, and the rotating 8-shaped windshield controls the flue gas and the air flows through the regenerative element alternately. In order to prevent the series flow of flue gas and air, reduce the air leakage coefficient, the rotor or stator flow section in the circulation of the total section of 10 to 20 of the two inert areas (sealed area).
