Rotary Concentrators are designed to take large volumes of air containing a very low concentration of volatile organic compounds (VOC's) and adsorb these organic materials onto a zeolite adsorbent material. This adsorbent material is contained in a continuously rotating (2-6 revolutions per hour) disc or 'rotor'. The rotor is divided into three (3) sectors, adsorption, desorption and cooling. The VOC laden air passes through the adsorption sector of the rotor where the VOC's are removed from the process stream and adsorbed onto the Zeolite honeycomb media. The process exhaust exits the adsorbent section without most of the VOC and is exhausted to the atmosphere. The adsorption section is about 84% of the rotor's media.
