A Rotary Evaporator, also known as a rotovap or rotary vacuum evaporator, is a laboratory instrument used for the efficient and gentle removal of solvents from samples by evaporation. It operates under reduced pressure and is particularly suitable for the concentration of volatile solvents, the reclamation of solvents, or the separation of solvent mixtures.

The basic principle of a rotary evaporator involves subjecting a sample in a round-bottomed flask to controlled temperature and reduced pressure. The flask is rotated on

its axis to increase the surface area exposed to the vacuum, which accelerates the evaporation process. As the solvent evaporates, it is condensed and collected in a separate container, leaving behind the concentrated sample or solute.
