A rotary granulator is a device that grinds wet powder blocks into granules by rotating. It can also break up strip-shaped or irregular fragile and loose materials, and form uniform and beautiful granules through a screen. The working principle of a rotary granulator is mainly based on the swinging action of the rotating drum and the filtering action of the screen. Through the swinging of the rotating drum, the wet powder raw materials are evenly distributed on the screen, and granules are formed through the squeezing and grinding action of the screen. At the same time, the cooperation of the press knife and the granulator knife can further compact and cut the material to form the required particle shape and size.

United States market for Rotary Granulator is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
