The global Rotary Voice Coil Motors (VCM) market size is predicted to grow from US\$ 1010 million in 2025 to US\$ 1511 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

Voice Coil Motors (VCM), also called Voice Coil Actuators (VCA), are a very mature design that utilizes a magnet and yoke in conjunction with a coil. The coil and magnet are concentric about a common axis and there exists an engineered magnetic return path. Rotary Voice Coil Motors (VCMs) are a type of electromechanical actuator designed to produce rotational motion. They operate on the same principles as linear voice coil motors but are specifically engineered for rotary applications.

Electromagnetic Principles: A Rotary VCM consists of a coil (the voice coil) placed within a magnetic field generated by permanent magnets. When an electric current flows through the coil, it interacts with the magnetic field, creating a rotational force.

Motion Generation: This rotational force causes the coil and the attached rotor to turn around a central axis. The direction and magnitude of the rotation are controlled by adjusting the current supplied to the coil.

Feedback Mechanisms: Many Rotary VCMs include feedback systems such as encoders to provide precise control over the position, speed, and torque of the rotational motion.

The demand for Rotary VCMs is growing in sectors where high precision and rapid response are critical. Innovations in VCM technology continue to expand their applications and improve performance.

Asia-Pacific is the largest consumption region due to its rapid industrialization and technological development, downstream demand of consumer electronics and automotive markets, etc.
