Rotating disc centrifugal atomization equipment is a special equipment for manufacturing metal powder. This equipment generates centrifugal force through a high-speed rotating disc to impact, disperse and condense molten metal flow or metal droplets into tiny particles, namely metal powder.

Specifically, when molten metal is added or sprayed into a high-speed rotating disc, the strong centrifugal force generated by the rotation of the disc throws the molten metal off the surface of the disc to form tiny metal droplets. These droplets will cool and solidify rapidly during flight, eventually forming the desired metal powder.

The rotating disk centrifugal atomization method can produce spherical particles with uniform particle size, excellent fluidity and arrangement, and no pores, so it has a wide range of applications in the field of metal powder manufacturing. In addition, by adjusting parameters such as the rotation speed of the turntable, the particle size of the powder can also be controlled to meet the needs of different fields.

The global Rotating Disk Centrifugal Atomization Equipment market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
