The research report highlights the growth potential of the global Rotogravure Printing Plate Cylinder market. With recovery from influence of COVID-19 and the Russia-Ukraine War, Rotogravure Printing Plate Cylinder are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Rotogravure Printing Plate Cylinder. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Rotogravure Printing Plate Cylinder market.

Rotogravure Printing Plate Cylinders are plates used in the gravure printing process. In gravure the printing form is typically a steel cylinder with a thin copper coating applied by electroplating. The vast majority of gravure presses print on rolls (also known as webs) of paper or other substrates, rather than sheets.

Gravure printing is the opposite of relief printing, in that the printing is done from ink that is below the surface of the plate. The design is cut, scratched, or etched into the printing surface or plate, which can be copper, zinc, aluminum, magnesium, plastics, or even

coated paper. The printing ink is rubbed into the incisions or grooves, and the surface is wiped clean. Unlike surface printing, gravure printing—which is actually a process of embossing the paper into the incised lines—requires considerable pressure.

Like engraving, gravure is a form of intaglio printing that produces fine, detailed images. Like flexography, gravure printing is often used for high-volume printing of packaging, wallpaper and gift wrap. Although less common, gravure printing may also be used for printing magazines, greeting cards, and high-volume advertising pieces.

As for the consumption, APAC is the largest consumer, who owned 63% share in global consumption market in 2022. The follower is Europe, accounting for 17% sales share.
