The characteristic of rotor kites is their 'rotor' design. This kind of kite is usually equipped with a finely processed skeleton, which is covered with a thin material (such as nylon silk) to form blades similar to helicopter rotors. These rotor blades are connected to the main body of the kite by ropes and play a key role in the flight of the kite. The flying principle of rotor kites is different from that of ordinary kites. It mainly relies on wind power and uses the rotation of the rotor to generate lift. When the kite is released and receives enough wind, the rotor will start to rotate. This rotation not only helps the kite maintain stability, but also generates additional lift through aerodynamic effects, allowing the kite to rise to a higher altitude.
