A rotorcraft satellite communication system refers to a satellite communication device installed on a rotorcraft (such as a helicopter). Through the forwarding function of the satellite, direct communication between the rotorcraft and the satellite is achieved, and then information is transmitted and exchanged with the ground station or other satellite communication terminals through the satellite's relay. This system combines the flexibility of the rotorcraft with the wide-area coverage capability of satellite communication, providing global communication guarantee for the rotorcraft. The rotorcraft satellite communication system includes a satellite communication antenna, a radio frequency unit, a modem, a control unit, etc., which is responsible for sending signals from the rotorcraft to the satellite and receiving signals from the satellite. The satellite acts as a relay station, receiving signals from the airborne equipment and forwarding them to the ground station or other satellite communication terminals. Depending on the application requirements, geosynchronous satellites or low-orbit satellites can be selected. The ground station is responsible for the operation and management of the satellite communication network, including signal reception, processing, forwarding, and access and control of user terminals.

The global Rotor-wing Airborne Satellite Communication System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
