Roughened nickel foil is a process of treating the surface of pure nickel foil by electrochemical methods, thereby obtaining a microscopic rough structure on the surface of the workpiece. This treatment changes the pure nickel foil from hydrophobic to hydrophilic, thereby improving the bonding force between the coating and the surface of the workpiece. The main purpose of roughening is to improve the adhesion and adsorption properties of metal surfaces and other materials.

The global Roughened Nickel Foil market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
