The Round Plunger Limit Switch is an electrical switching device with a cylindrical push button head. It is often used to detect or control the position or range of motion of an object. The main components of the cylindrical push button limit switch include a push button head and a bracket. A push button head usually consists of a cylindrical stem with a button mounted on top of it. The bracket is used to fix and support the push button switch. When the object to be monitored touches or pushes the push button

head, the push button head is subjected to pressure, which triggers a change of state of the switch. This can trigger an electrical signal by opening and closing electrical contacts inside the switch to indicate the location of an object, reach a specific location or range of locations, or trigger other related actions. Cylindrical push button limit switches usually have the characteristics of simple structure, convenient installation and high reliability. They are widely used in automation equipment, mechanical engineering, industrial control systems, conveying systems and other fields for functions such as position detection, position control, safety monitoring and mechanical protection. Due to their push button shape, they are particularly suitable for applications requiring manual operation or manual triggering.
