The global ROV Hull Cleaning Service market size is predicted to grow from US\$ 487 million in 2025 to US\$ 1509 million in 2032; it is expected to grow at a CAGR of 17.6% from 2026 to 2032.

ROV hull cleaning services are specialized cleaning and maintenance services for the underwater structures of ships, based on remotely operated underwater robot technology. This service efficiently removes marine biofouling, sediment, and corrosive deposits from the hull plating, propellers, rudder blades, and other underwater components, while simultaneously performing localized condition checks and image acquisition. Compared to traditional manual cleaning methods by divers, ROV operations offer greater safety, stability, and continuous operation capabilities, enabling them to perform tasks in complex sea conditions or high-risk environments, while significantly reducing personnel operational risks and downtime. By reducing hull surface roughness, this service helps reduce drag, optimize fuel consumption, and improve overall ship operational efficiency, making it an important technological component of modern ship underwater maintenance systems.

Against the backdrop of the global shipping industry's continued emphasis on cost control and energy conservation and emission reduction, underwater hull cleaning, as a crucial link directly impacting fuel efficiency and carbon emissions, is experiencing continuous market demand growth. Driven by increasingly stringent international environmental regulations and volatile fuel prices, shipping companies are placing greater emphasis on improving vessel energy efficiency through periodic or dynamic cleaning and maintenance. This is transforming such services from supplementary maintenance into routine operational management strategies. In the future, with the development of underwater robotics, artificial intelligence visual recognition, and high-

precision sensing systems, ROV hull cleaning services will further evolve towards intelligence and automation, achieving autonomous path planning, soiling identification, and adaptive adjustment of cleaning intensity. Simultaneously, through integration with ship digital twin systems and data-driven detection platforms, this service is expected to expand into an integrated 'cleaning + detection + assessment' solution. This will improve operational efficiency while providing data support for ship health management and predictive maintenance, driving the industry towards greater efficiency, safety, and intelligence.
