The global Roving Frame market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The roving frame is a machine in the spinning production line, used to convert raw materials such as cotton, wool, silk, etc. into roving. The function of the roving frame is to carry out preliminary textile processing of raw materials, stretch and refine the fibers, and form yarn suitable for subsequent spinning processing. The roving frame usually consists of multiple components, including yarn feeder, pulling device, carder, drafter, winder, etc. Its working principle is to stretch, twist and refine the fibers in the raw material through a series of movements and traction, and finally form yarn. During this process, the roving frame will also remove impurities, short fibers, etc. in the raw materials to improve the quality and uniformity of the yarn. The working speed and production capacity of roving frames are usually high, which can meet the large-scale production needs of spinning mills. It is one of the key equipment in the spinning production line and plays an important role in the production efficiency and product quality of the spinning mill.
