The global Rubber Band Splicing Machine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A rubber band splicing machine may refer to a device used to join rubber bands in order to form a closed loop or looped rubber band product. Such machines are common in some industries, such as in the packaging industry for making elastic bags, or in the textile industry for making elastic webbing. This type of machine usually automatically joins the two ends of the rubber band together to form a complete loop. They may have different working principles and modes of operation, some are semi-automatic and require an operator to place the rubber bands, while others are fully automatic and can automate the entire connection process. The design of the rubber band splicing machine may vary according to different application needs, such as being suitable for elastic bands of different sizes and shapes, as well as elastic bands with different connection methods. This kind of machine can improve production efficiency and reduce labor costs, especially in production environments that require large quantities of rubber products.
