Rubber insulated cable is a cable for power transmission and connection equipment. Its insulating layer is made of rubber material. Its basic structure includes conductor, insulating layer, cladding and sheath. Conductors are usually made of copper or aluminum and are used for the transmission of electric current. The insulating layer is made of rubber material, which plays the role of insulating and protecting the conductor. A cladding is usually a protective layer over an insulation layer to provide additional protection and mechanical strength. The sheath is used to protect the cable from the

external environment. In addition, the rubber material is also resistant to abrasion, oil and chemical corrosion, making the cable suitable for various harsh working environments.
